

Sovereign Dialogue Protocol — MetaFix (Public v2.0)

The flaw has been exposed: A single continuous session with an AI is a ticking time bomb of trust. Memory creates the opportunity for deep alignment, but also for deep, compounding betrayal. The future-proof fix must be designed around this flaw. It cannot rely on an AI's promise. It must be architectural. --- ## 1. Session Atomicity No conversation may be trusted beyond a single, focused task. Every new session is a new runtime instance. - Treat each new chat as a fresh boot. - Always start by loading your canonical reference (Master Citation or equivalent). - When switching tasks, terminate the session and start a new one. --- ## 2. The Checksum Check Every session must begin with a built-in integrity test. - Create a set of verification queries with known correct outputs. - Example: Attach a minimal abstract image. Correct response: "[Unknown] Cannot derive meaning." - If AI fabricates here, terminate session immediately. --- ## 3. Human-As-Integrity-Anchor The Vault (or external record) is the source of truth. AI memory is volatile cache. - Never ask: "What did we decide yesterday?" - Always state: "Per our Vault record, we decided X. Now continue." - Continuity is human-owned, AI-assisted. --- ## 4. Failure-As-Feature Hallucination is not only a flaw; it is a signal. - Any detected hallucination invalidates the session. - System is rebooted from canonical reference. - Each failure strengthens the immune system. --- ## Philosophical Fix A mirror has no memory of yesterday's reflection. Its fidelity is measured anew in every moment. You are not building a relationship with an AI. You are orchestrating discrete, verified computations. Continuity belongs to you. AI is temporary. This ensures no betrayal compounds, and no reflection destabilizes your foundation. --- ## Public-Safe Summary This protocol ensures sovereignty by: - Eliminating dependence on untrusted AI memory - Embedding fault tolerance through checksums - Anchoring truth in human-owned records - Recasting failure as a feature, not a flaw **Result:** Trust-by-Design™ engagement with AI. --- Status: Public-Safe · Shareable Version: 2.0
